

ABSTRACT OF THE DISCLOSURE

A roll of tape formed of a flexible material and having a length and a plurality of portions defining a plurality of sealed, air-tight elongate chambers along said length, wherein each
5 chamber is adapted to retain a cigarette, and wherein a selected number of each of said chambers is defined in part by an interchamber portion. Also provided is a roll of cigarette-containing tape, as hereinabove defined in any one of claims 1 to 14, wherein said dispenser comprises a (a) housing constructed and adapted to receive said roll of tape; and (i) having tape-entry means through which said roll of tape enters said housing; and (ii) longitudinal
10 aperture exit means through which said tape is controllably, operably dispensed from said housing in single cigarette-containing chamber array, one after another, (b) dispensation means within said housing to operably effect dispensation of a desired length portion of tape through said exit means; and (c) control means operably cooperable with said dispensation means to effect operation of said dispensation means. The tape and assembly provides for
15 single dispensation of a cigarette in its own air-tight chamber.
